## **Higher Order Spectra Analysis**

Higher-order spectra which are defined in terms of the higher-order moments or cumulants of a signal, contain this additional information. The Higher-Order Spectral Analysis (HOSA) Toolbox provides comprehensive higher-order spectral analysis capabilities for signal processing applications.

Further, in the case of harmonic processes, the power spectrum and parametric methods based on the autocorrelation are usually sufficient, unless the data contain narrow-band Gaussian components. Higher-order cumulants and spectra are useful to isolate specific types of coupling (quadratic, cubic, etc.).

In statistics, the term higher-order statistics (HOS) refers to functions which use the third or higher power of a sample, as opposed to more conventional techniques of lower-order statistics, which use constant, linear, and quadratic terms (zeroth, first, and second powers). The third and higher moments, as used in the skewness and kurtosis, are examples of HOS, whereas the first and second moments, as used in the arithmetic mean (first), and

## **Higher-order statistics - Wikipedia**

Higher order spectra were originally introduced as spectral representations of cumulants or moments of ergodic random processes. They were used in the identification of nonlinear systems and non-Gaussian random processes and phase coupling in wave-wave interactions.

## **A Review of Higher Order Statistics and Spectra ...**

Higher-order spectral methods enable the visualization of the transfer of energy from one frequency to another, a hallmark of nonlinear phenomena that is not visible using traditional spectral methods. The paper is organized as follows. A description of HOS methods is provided, including two illustrative examples.

Generalizations Bispectra fall in the category of higher-order spectra, or polyspectra and provide supplementary information to the power spectrum. The third order polyspectrum (bispectrum) is the easiest to compute, and hence the most popular. A statistic defined analogously is the bispectral coherency or bicoherence.

As a result the bispectrum is particularly of use when the analyst wishes to detect quadratic (or other even powers of) nonlinearity. The next in the series of higher-order spectra is the fourth-order spectra, the trispectrum. The trispectrum is particularly useful when analysing a signal for cubic (or other odd powers of) nonlinearity.
